Re: Teamlead Data Operations

Dear Neura Robotics Team,

My current research sits at the same intersection your Data Operations team works in every day. I lead the data pipeline for a brain-computer interface project that turns EEG signals from children with severe neurodegenerative conditions into a channel they can control. The underlying challenge is the same one behind RoboGym: transforming messy, human-generated data into something a learning system can trust. This is the work I want to continue, at greater scale and with broader impact.

My academic path has not followed a straight line, and I consider that an asset. I studied cognitive science in Tübingen, spent a year in Lisbon, completed a master's degree in scientific computing in Heidelberg, and spent a year of that degree in Milan, where my Italian became fluent alongside native German. Each transition required adapting quickly to a new institution, team, and even language, and I have learned to keep that adjustment period short as a matter of course.

On the technical side, I built the full data pipeline, from acquisition to model-ready datasets, for a research collaboration with other institutions, and I set the quality and documentation standards used across the project. On the people side, I have taught and mentored technical cohorts and coordinated data-sharing agreements across three institutions in two countries without missing a deadline. I do not treat these as separate skill sets: leading a data operations team requires exactly this combination of technical judgment, process design, and stakeholder alignment.

I manage several responsibilities in parallel as a matter of practice. Alongside my research and teaching, I completed a sports nutrition certification out of personal interest, and volunteered in Olympic Village operations for Milano Cortina 2026 and in event logistics for the Wizz Air Marathon. Both required keeping a system running smoothly under a fixed deadline with many moving parts, which is the same discipline a data operations role demands on a regular basis.

Neura Robotics stands out to me for the scale of what it is building on top of good data, not just good hardware. The Neuraverse platform, the push toward a series-production humanoid in 4NE1, and the RoboGym partnership with TUM all depend on teleoperation data that is consistent, well-documented, and trustworthy enough to train on at scale, particularly as the company grows past a thousand people across sites in Munich, Metzingen, and Zurich. I also recognize the company's mission, 'we serve humanity' in my own background: my research already applies advanced technology to genuinely improve people's lives, and I want to keep doing that at industrial scale rather than lab scale. I would bring genuine comfort with ambiguity, a record of setting standards that outlast individual projects, and the language range to support a Munich-based, international team. I welcome the opportunity to discuss how this could work in practice.

Best regards,

Lia Schmid
